

Entity Relationship Diagram:

This data model defines the relationship between different entities. Like, a customer can have multiple loan applications, each loan application can have one approval, each approval can lead to one disbursement and one loan disbursement can lead to only one loan collection for a customer.

System Architecture:

- ✓ **Presentation Layer:** This layer handles user interactions, including the online loan application module, loan officer user interfaces, and notifications to customers about their loan application status.
- ✓ **Application Layer:** This layer consists of microservices that are responsible for various aspects of the loan management process including loan origination, approval workflows, disbursement, and collection. Each microservice manages specific functions and communications with other layers as needed.
